

# Marine Life of Nelson Bay by Tom Davis

## Nodular Nudibranch Species

Nudibranchs are a group of molluscs which is distinguished by having external gills towards the back on the upper surface of the body, or along both sides of the body. Species have been sorted on this website by body patterns and markings (ie spotted, lined, plain, cerata or nodular). A total of 70 species of Nudibranchs and 15 species of other types of seaslugs, from Port Stephens and surrounding waters, are shown.

*Atagema intecta*

*Crosslandia daedali*

*Dendrodoris denisoni*

*Dendrodoris gunnamatta*

*Hancockia burni*

*Hoplodoris nodulosa*

*Melibe australis*

*Nembrotha rosannulata*

*Neodoris chrysoderma*

*Plocamopherus tilesii*

*Plocampherus imperialis*

*Tritonia* sp1

*Tritonia* sp2

*Tritoniopsis elegans*
